

27TH ANNUAL

Building Champions: Constructing  
the Game Plan for Lean Success

# Beyond Post-its: Mastering Pull Planning

October 22, 2025

Thomas LaMay  
Project Leader  
DPR Construction

# BEYOND POST-ITS

A practical guide to creating reliable pull plans and optimal flow through **Specificity** and **Adaptation**.

**THOMAS LAMAY**  
[thomasla@dpr.com](mailto:thomasla@dpr.com)

# Six Tenets of Lean Construction

- 1. Respect for People**
- 2. Optimize the Whole**
- 3. Generate Value**
- 4. Eliminate Waste**
- 5. Focus on Flow**
- 6. Continuous Improvement**

# Continuous Improvement

Lean thinking demands a mindset of continuous improvement.

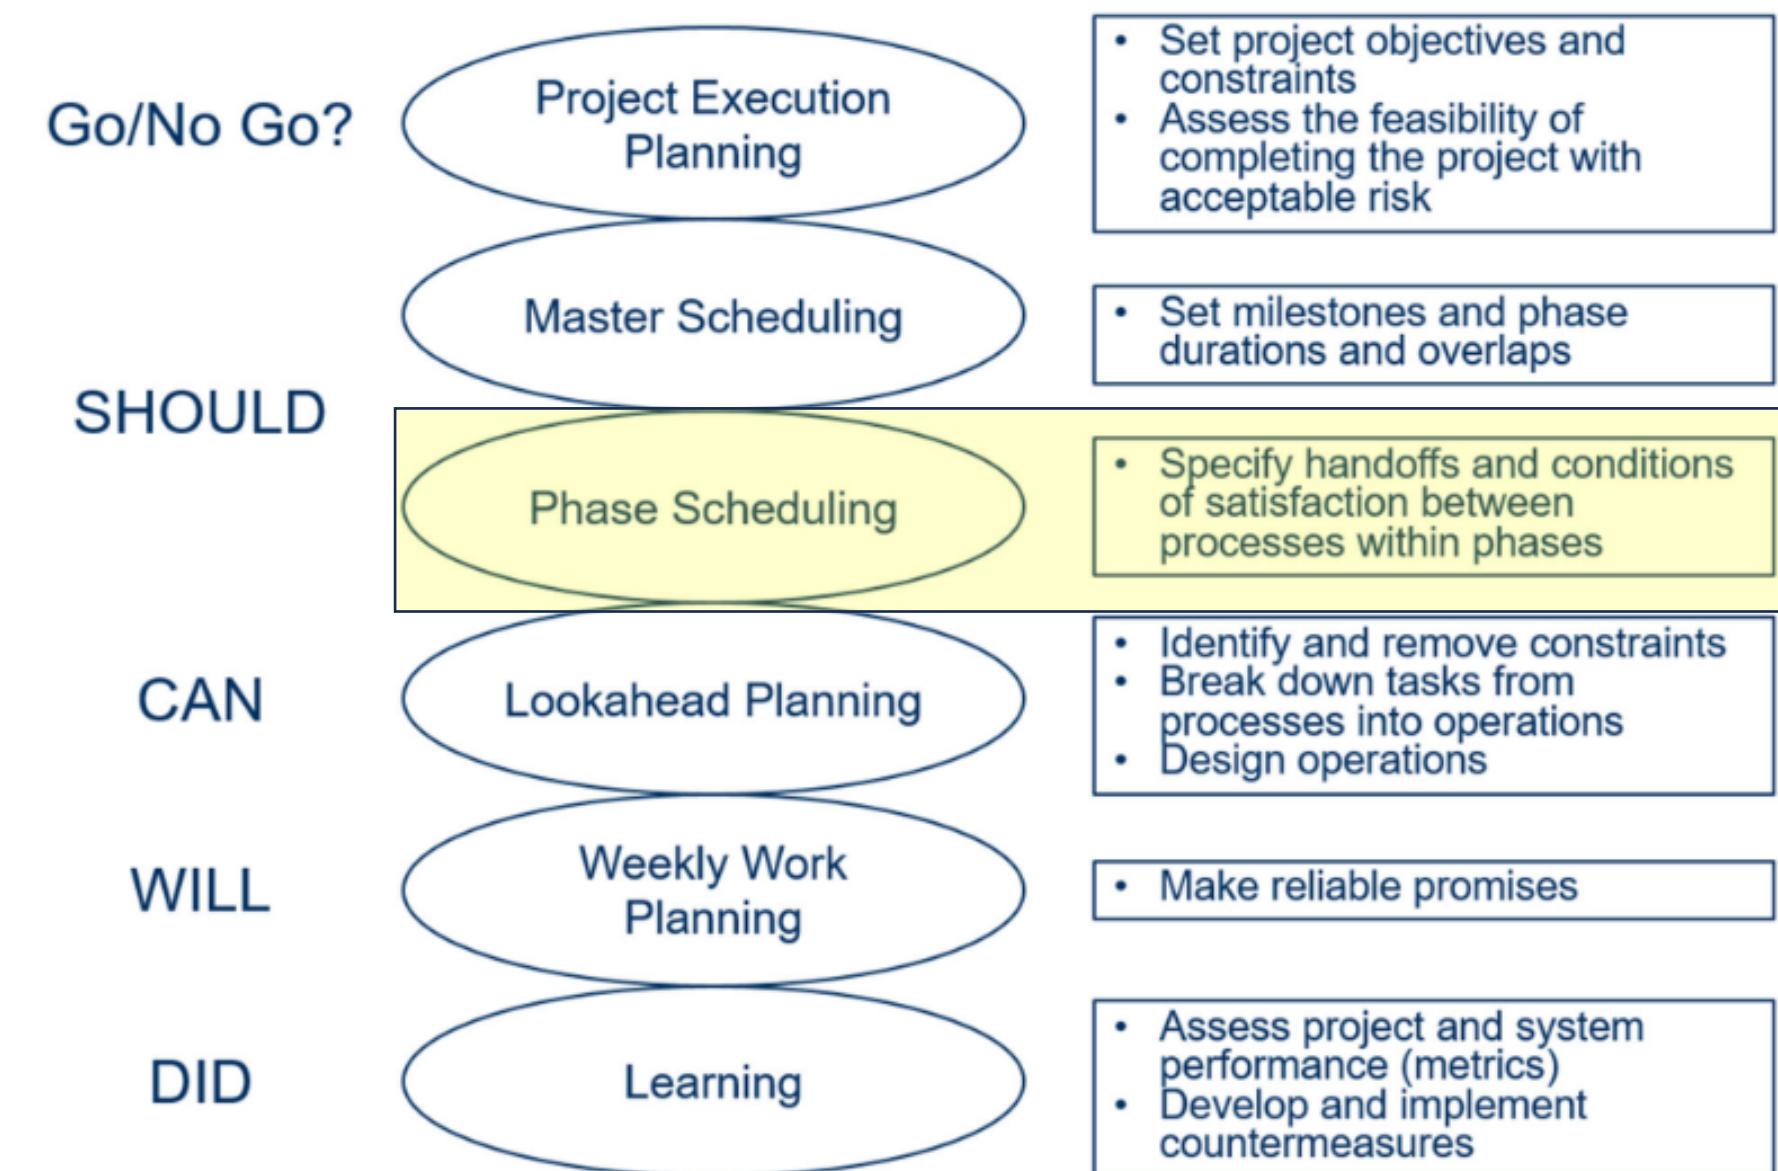

This requires an environment where we can discuss what's not working well and find fixes.

# Problem Statement

**Project schedules are often unreliable as rigid planning methods which fail to address the dynamic nature of construction.**

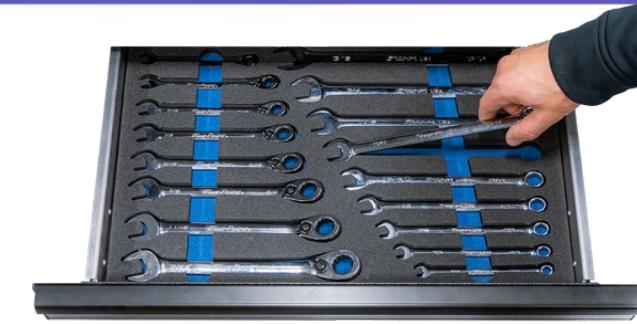

**Superficial pull planning, lacking specificity and detailed operational design, further contributes to this unreliability.**

# Why Rigid Plans Fall Apart

Why do so many of our plans fail?  
Because we often fail to honestly answer  
these two questions:

1. Is our plan built on a system of detailed inputs, or a shaky one based on a series of assumptions?
2. If we find an error in our decision or logic, can we rapidly pivot and reroute for optimal flow, or are we forced to double down on existing resources (e.g., overtime, trade stacking, delay notices)?

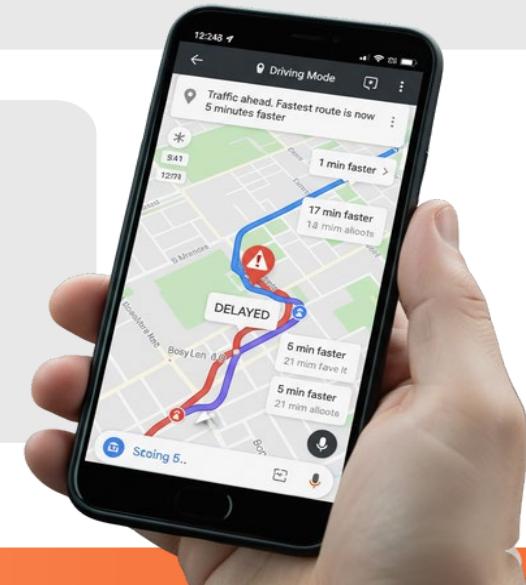

## Lack of Specificity

We often fail to prepare the right people, information, and environment.

## Lack of Adaptation

Driven by an unspoken fear of our system's fragility, we treat our plans as a roadmap, unable to creatively respond to the reality of constraints.

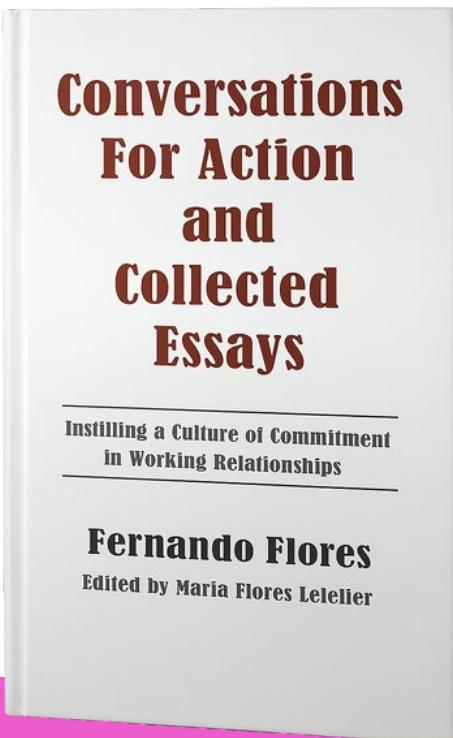

## Academic INSIGHT

- Technical Systems Fail Without Adaptation.
- Rigid 'Push' Planning Creates New Problems.
- All Plans Are Inherently Inaccurate.
- Warning Signs Are Often Ignored.

# A Framework For Practice: Pillar 1 - Specificity

To counter the "double problem" of rigid plans, use a pull planning practice built on two foundational pillars.

“Management is a network of conversations and commitments.” Fernando Flores

**Use deliberate preparation to counter the primary reasons plans fail.**

## Standardize the Roles:

- **The Facilitator:** Guides the conversation and maintains a collaborative environment
- **The Builder:** Makes final decisions on the plan itself to resolve technical issues and align with the project goals.
- **The Project Leader:** Manages session logistics and external factors like business agreements and owner/designer constraints.
- **Commitment Maker:** Act as ambassadors for their companies, making reliable promises based on their deep technical knowledge.

### Conditions of Satisfaction (CoS):

1. **Request:** The Customer makes a specific request to a Performer.
2. **Negotiation & Promise:** The Performer can accept, decline, or counter-offer.
3. **Performance:** The Performer does the work they promised.
4. **Declaration of Satisfaction:** The Customer reviews the work and formally declares that it is complete and satisfactory, closing the loop.

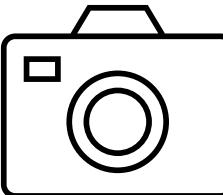

### A Clearly Written Invitation:

1. **The Specific Goal:** A clear statement of the milestone or phase of work.
2. **A Written Set of Expectations for Commitment Makers.**
3. **The Desired Outcome:** A definition of the session's tangible output. *“A coordinated production plan for the 3rd floor Overhead MEP rough-in...”*

# Specificity: Work Density

## Define the Building Blocks

Overlay a grid onto your floor plan.

## Collect Production Data (Inputs)

- Quantity:** The total amount of work units required for a specific task within that Cell.  
(Hang Drywall → 1,500 square feet of drywall in Cell A1.)

- Production Rate:** The time it takes the crew to complete one unit of work.  
(Drywall Crew → 0.005 hours per square foot.)

## Calculate Work Density (The Formula)

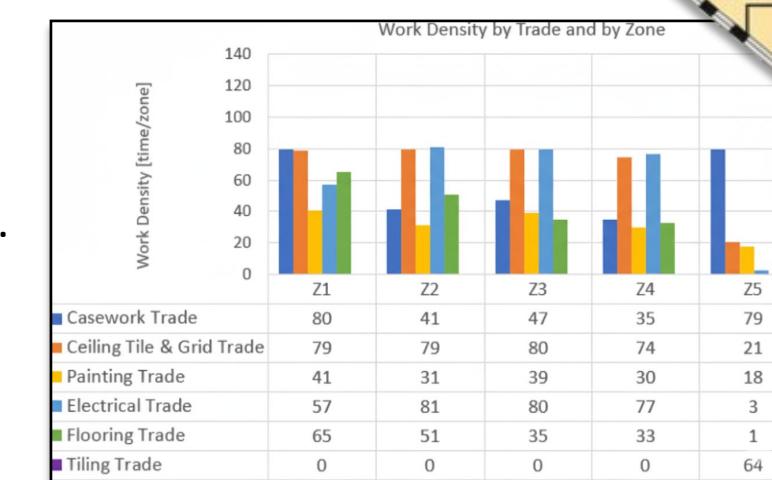

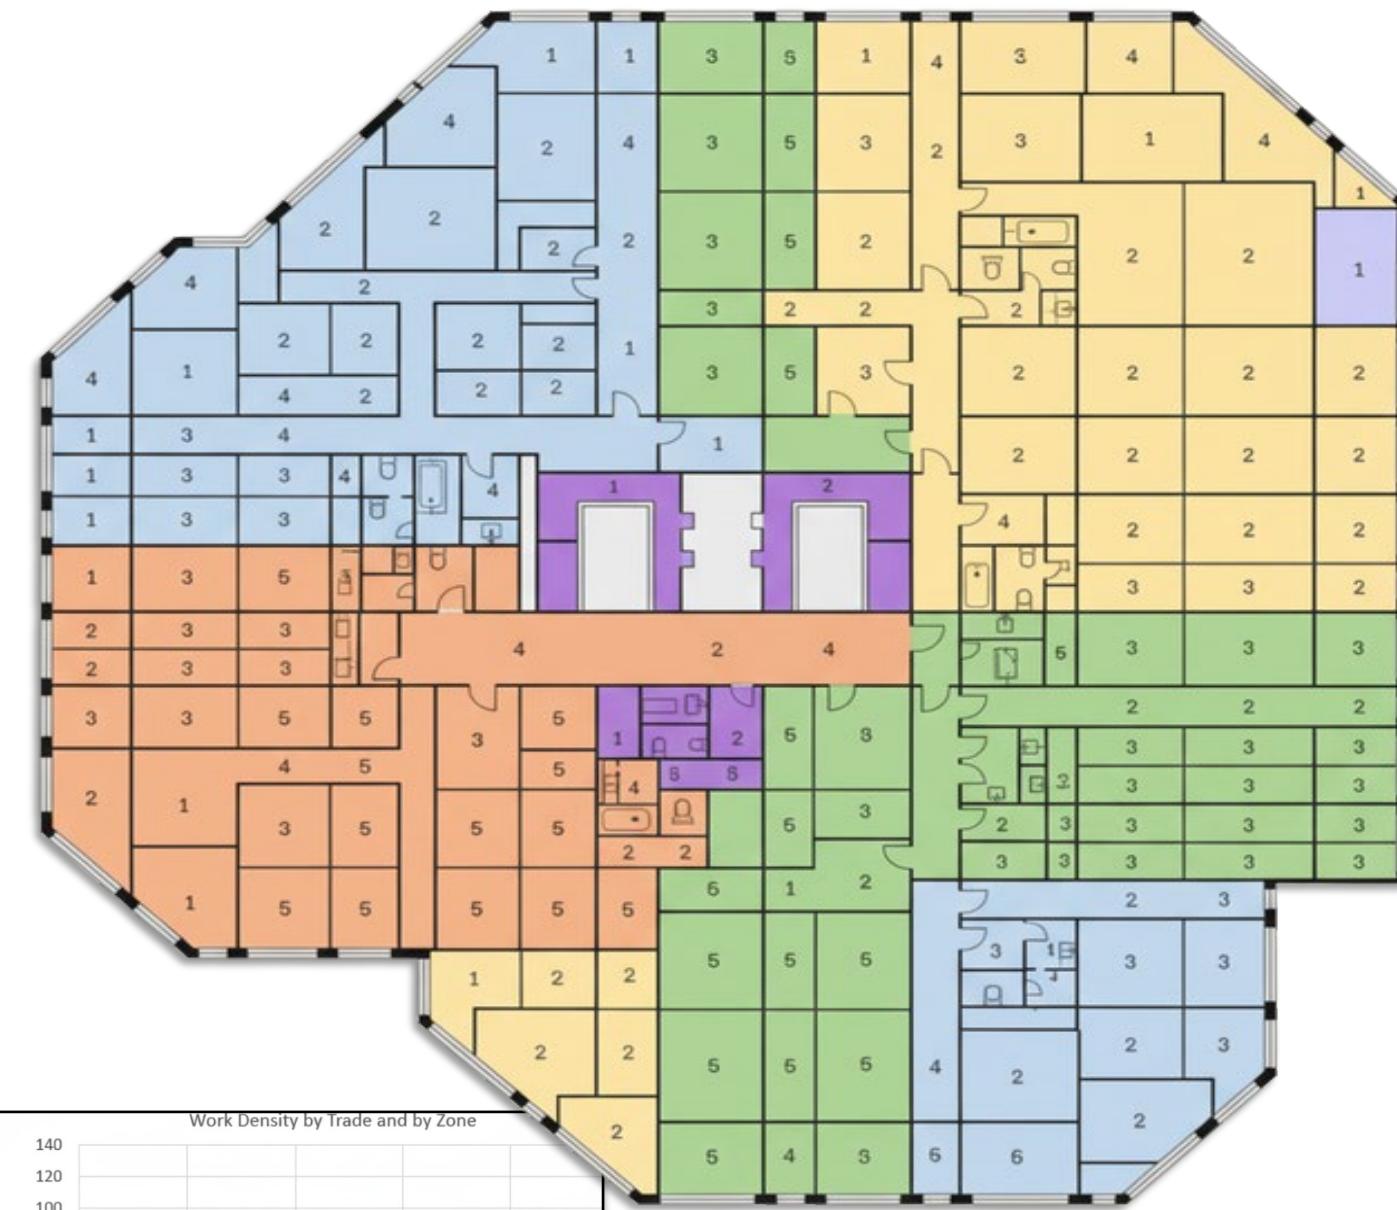

$$\text{Work Density [Time]} = \text{Quantity [units/area]} \times \text{Production Rate [time/unit]}$$

Drywall Workload in Cell A1:  $(1,500 \text{ sqft} \times 0.005 \text{ hours/sf}) = 7.5 \text{ hours.}$

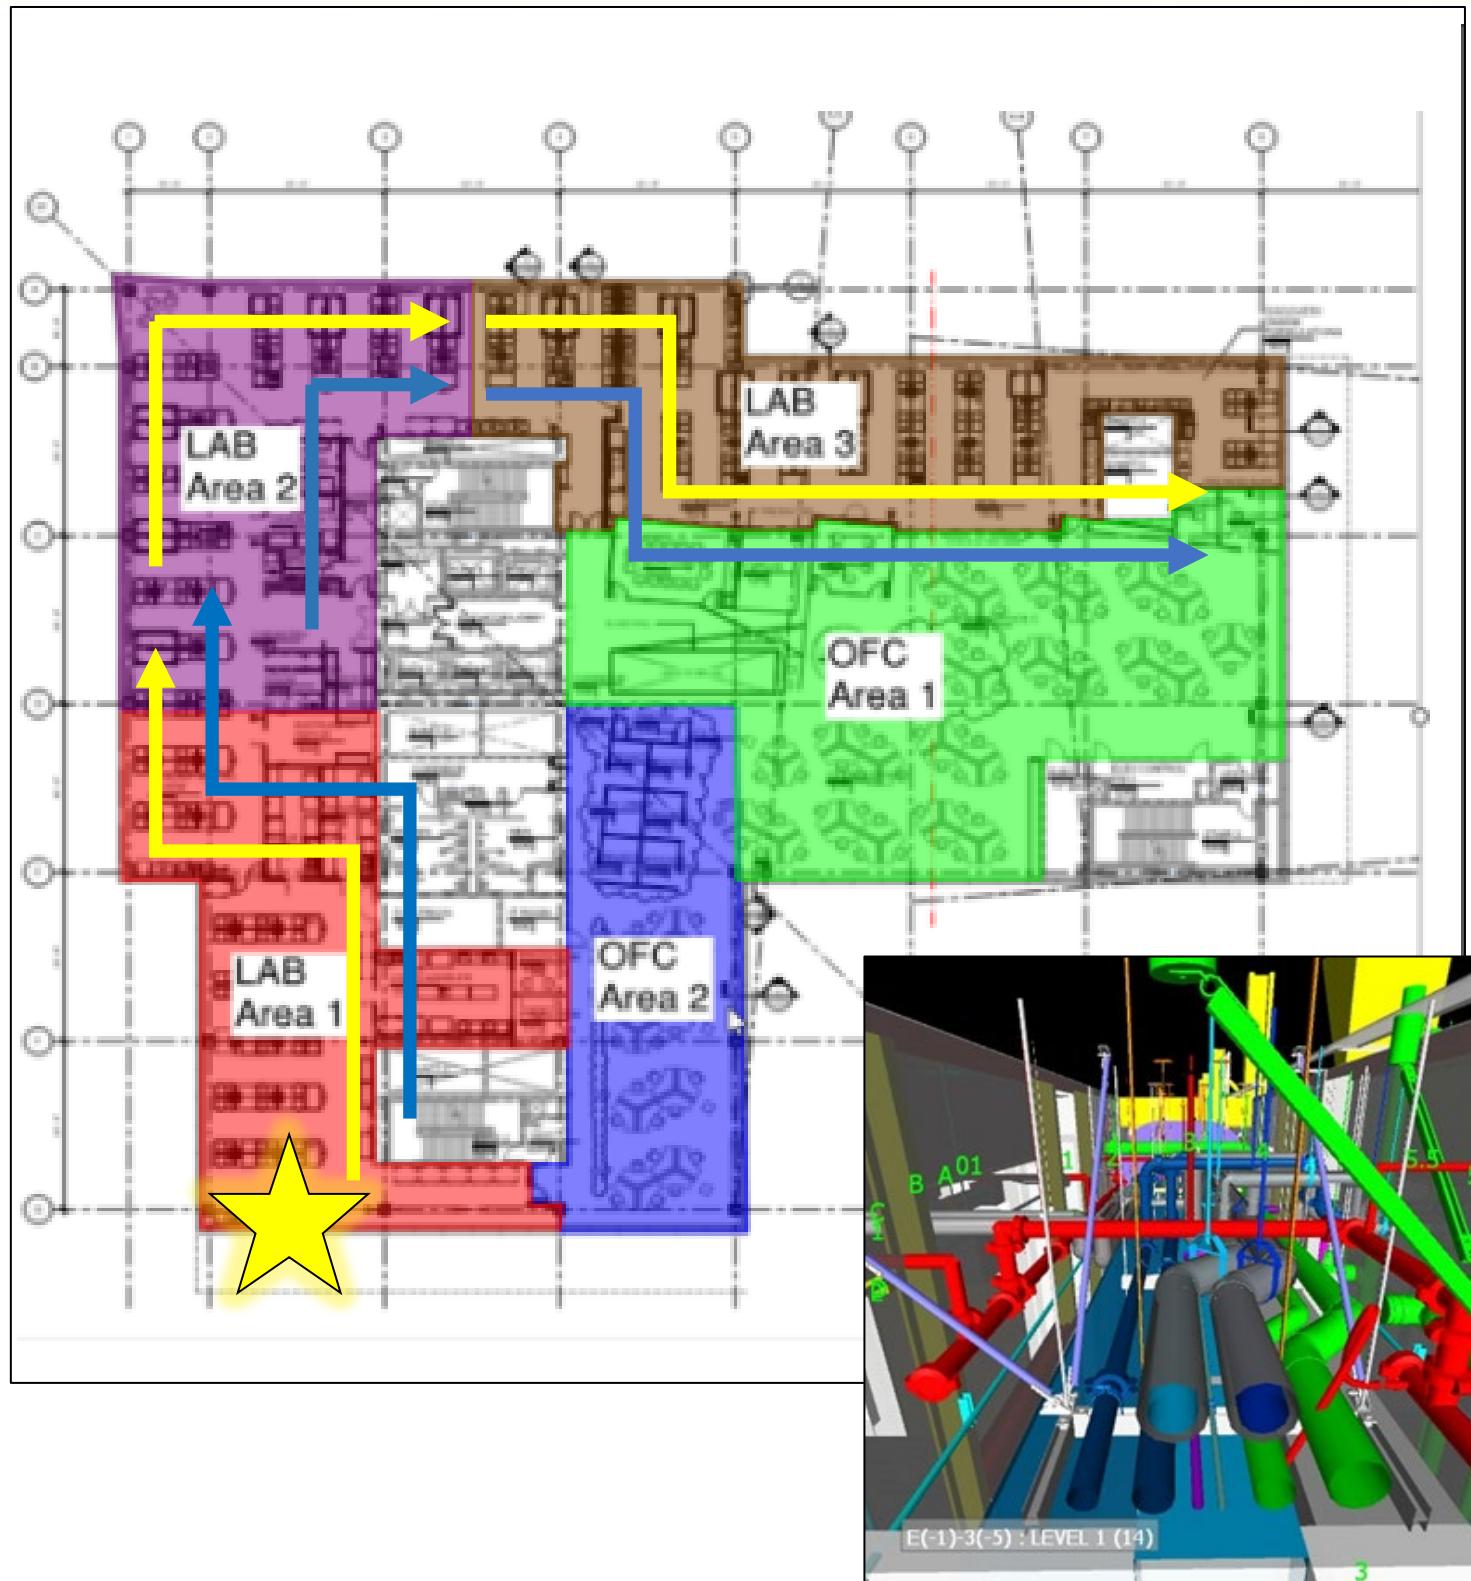

Show the number “7.5” in the Cell.

## Model and “Level” the Workload

- Use a separate table or graph which sums the Work Density of all cells assigned to a Zone.
- Adjust the boundaries the zone or crew sizes until the work density is balanced across zones

# Specificity: Work Direction and Starting Position

## Establish Directional Flow and Starting Position

Ask the question: “Which functional area or system needs to be available first?

THE ANSWER TO THIS QUESTION “SETS” THE STARTING POSITION.

### Example:

“Priority Walls, Window Soffits then Fire Sprinkler, Mechanical piping, Overhead Electrical and Supply HVAC in “Lab Area 1” must be complete first to release the office areas. Also, Area 1 must be completed before Area 2 and 3.”

“Therefore, **Lab Area 1** is the starting position, work direction is West to East, Office areas follow the Labs.”

## The “Parade of Trades”

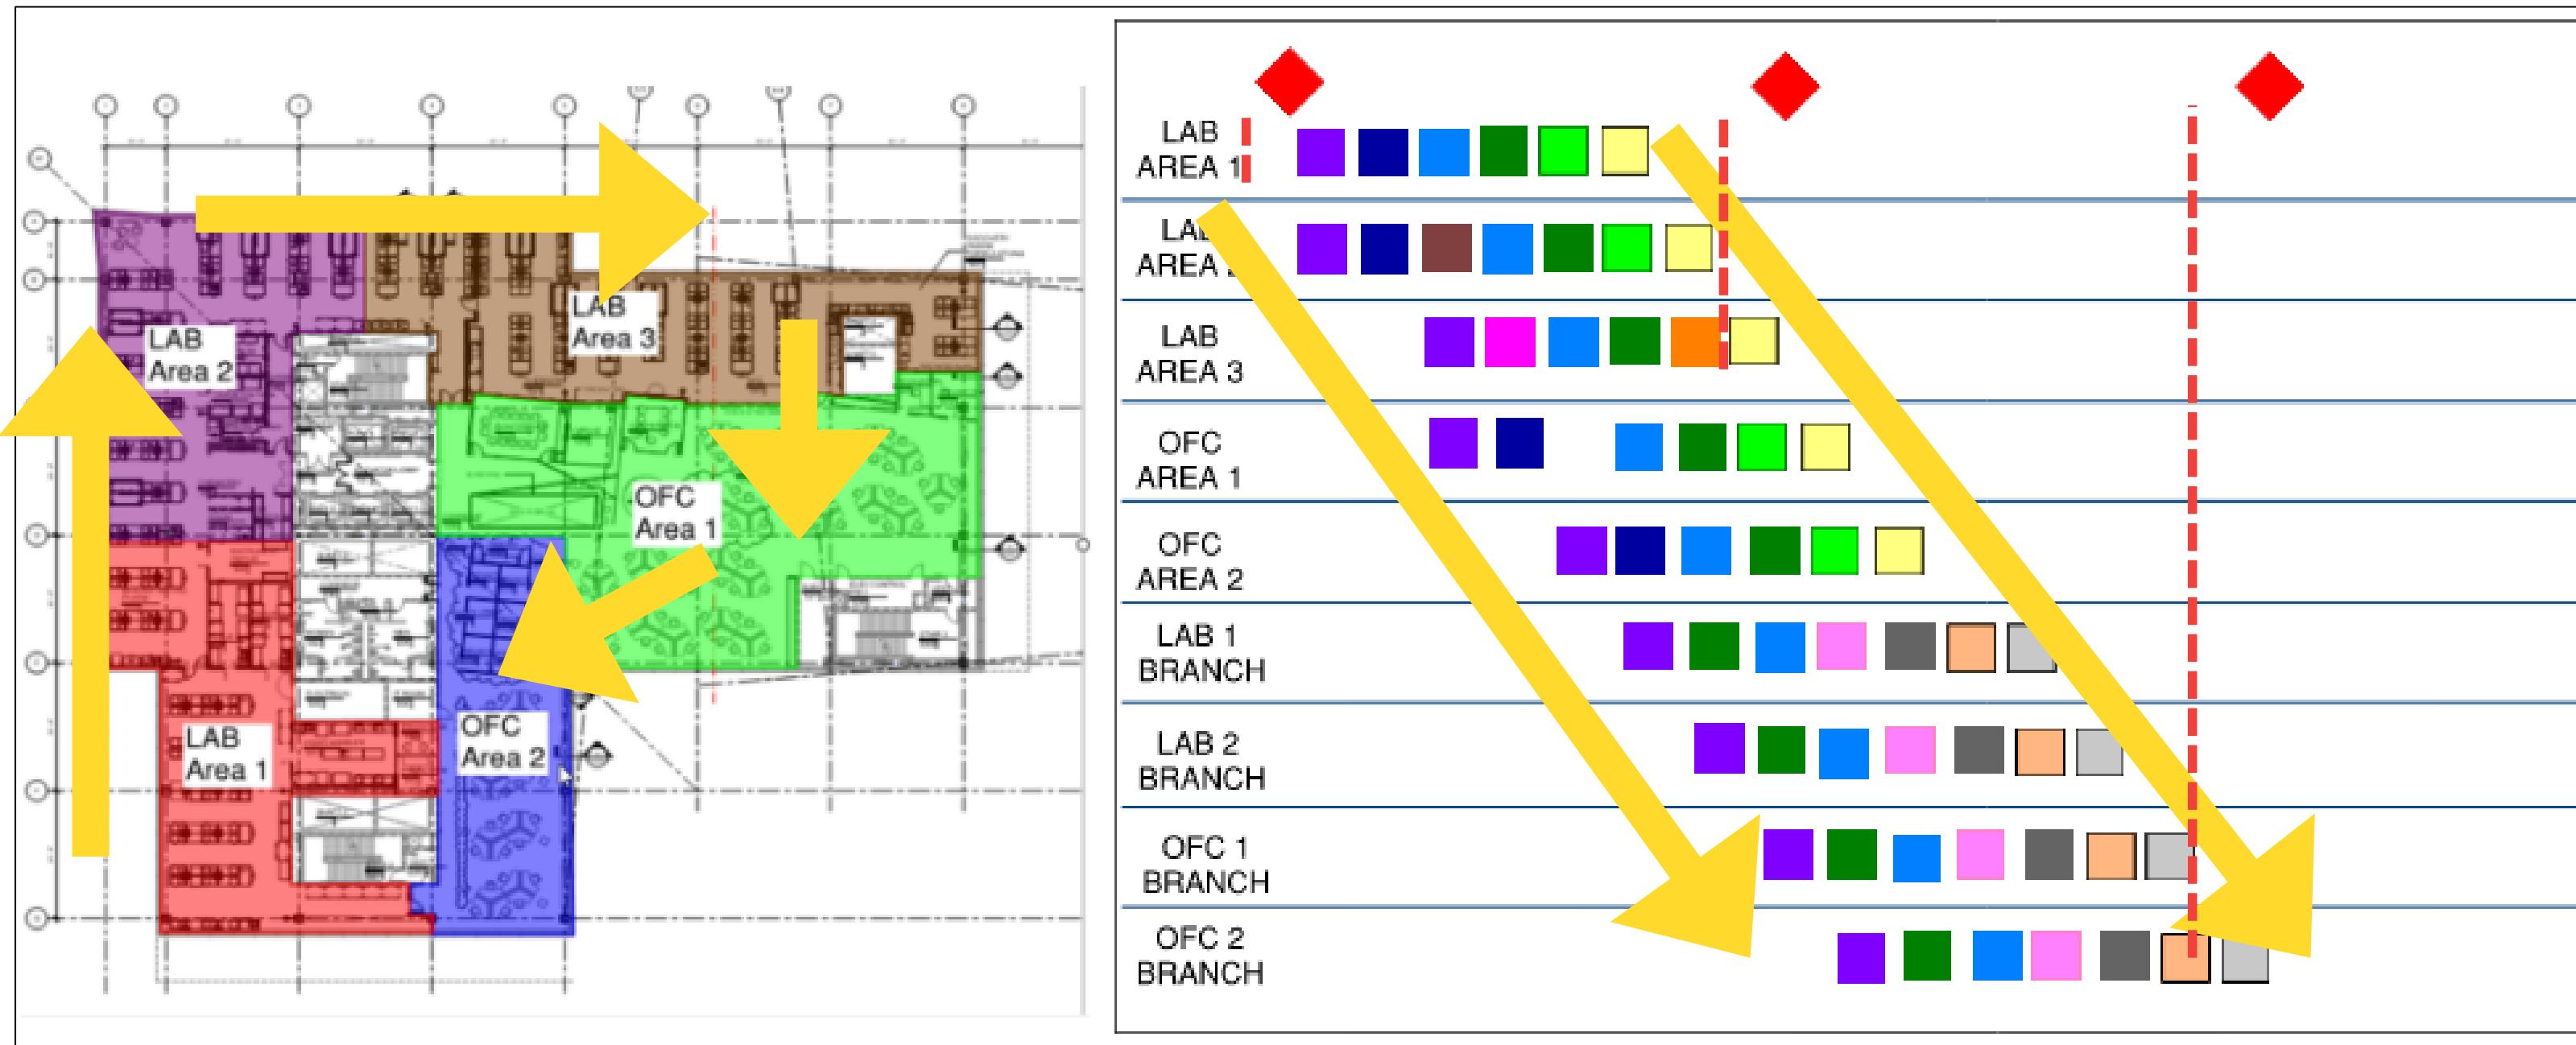

In each area, the sequence reinforces the direction. This is done by defining the Parade of Trades (e.g., the Electrician must follow the Framer).

**Action:** Define the order of steps required to complete the work (e.g., Electrical → Drywall → Paint). Pay special attention to utility crossings and overhead MEP/F sequences!

**Result:** This sequence of trades dictates the directional movement through the zones. When the Electrician finishes Zone 1, they move to Zone 2; the Drywall crew follows them into Zone 1, and so on.

# Specificity: The “Train of Works”

The “Train of Works” is the specific sequence that groups the tasks and arranges their movement to keep the work flowing and prevent stacking.

# “Bias Buster” Exercise

Think about how our own actions accidentally “kill” great ideas. **This IS NOT about blaming.** it's about seeing patterns so we can interrupt them.

## 3 Minutes

Share an experience you have witnessed, or done yourself, that **blocked creativity** or shut down a new idea in a group setting.

### Examples:

“At the staff meeting, my manager checked his email on his phone while I was discussing next week’s pull planning session”

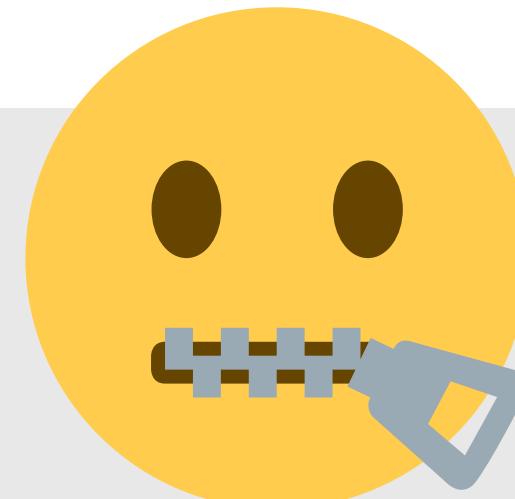

“The Architect filled out one sticky that said “100% CD’s COMPLETE” and then left after 10 minutes.”

“The Superintendent put dates from the P6 schedule as the only milestones to pull from and yelled at us to ‘STOP SAND BAGGING.’”

## 3 Minutes

**Reflection** - What was the impact on the person, the idea, or the team’s momentum?

## Common Behaviors

- “We tried that before”
- Dominating the Conversation
- Sighing/rolling eyes

## Impact

- Withdrawal/Silence
- Reduced Trust
- Lower Quality of Follow Up Ideas

**Behaviors =/= Intent:** Even small, non-malicious action (like a looking at your phone) has an impact.

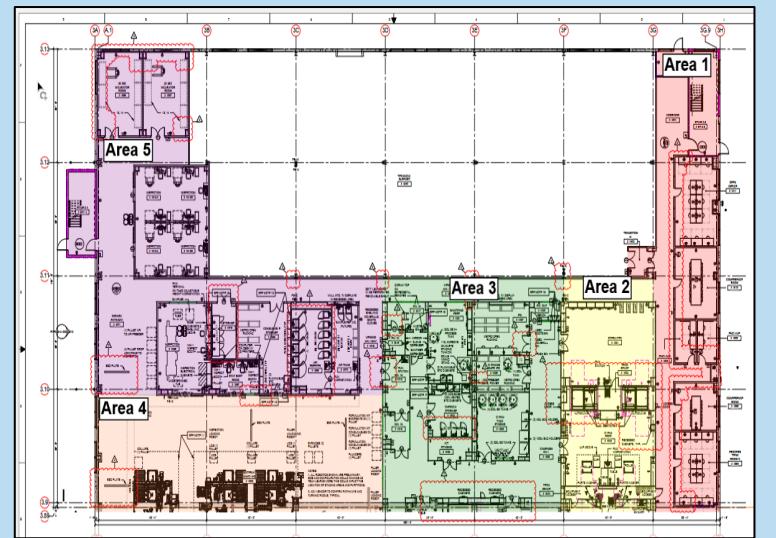

**The True Cost of Silence:** the tangible loss incurred when a bad assumption is allowed to become an action or a decision because no one voiced a necessary concern, challenge, or alternative view.

# Framework For Practice: Pillar 2 - Adaptation

## The Rules of Visual Planning

Use a shared language that can be adapted by everyone participating.

DPR CONSTRUCTION	
Trifecta	Red
DPR SPW	Purple
EIG	Green
McKenney's	Magenta
PC Jackson	Cyan
Performance	Blue
TS Woodworks	Orange

### Color Legend

### Defined Zones

### Task Descriptions Hand Offs

TAKT PLAN HAND OFF DESCRIPTIONS		
Task / Week	Company	Activity
1	ACIP	Verify clarity: Vertical stiffi attachments at a minimum, softi framing. Install all ACP and leave the site level? As built details of top of piles.
2	GRADING CLEAN UP	Work: Temp power foundation for lower crane (DPR concrete scope). Safety/Quality: As built details of the top of piles. Piles in or out of tolerance?
3	EXCAVATION	Verify/clarity: Certified pad. Work: Daily street sweeping. All concrete removed. Install erosion control temp entrances. Overbuild building pad. Sheet piles/steering. Safety/Quality: Clean up and leave it like you found it.
4		Verify/clarity: Start with a clean site. Prior to excavation layout entire site control. Ex footing and rat tabs as you open excavation. Off hand daily rate (12d depending on soil type). Evaluate bank protection as work is ongoing.
5		Safety/Quality: Trench cave in's. Over cut make sure you have clearance for rat slab and bar install. Clean up and leave it like you found it.
		NOTES

### Adapting Through Reliable Promising

1. A clear request.
2. well-defined Conditions of Satisfaction.
3. An explicit "Yes" or "No" commitment.

## Adapting for Flow

### Using The Theory of Constraints (ToC)

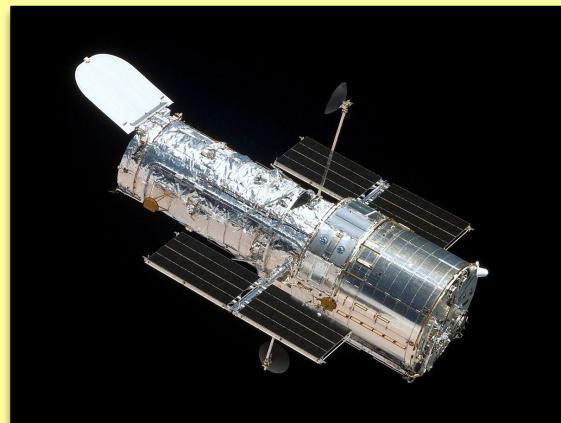

**Identify & Focus on the Constraint.**

**Protect the Constraint.** Ensure all other tasks support the constraint's operation.

**Re-sequence Non-Constrained Work:** Re-arrange tasks for non-constrained resources to ensure they support the smooth flow through the constraint.

**Why?**

1. **It does not speed up the overall schedule**, because the constraint is still the one dictating how fast the phase is completed.
2. **Completing tasks too quickly introduces mistakes.**

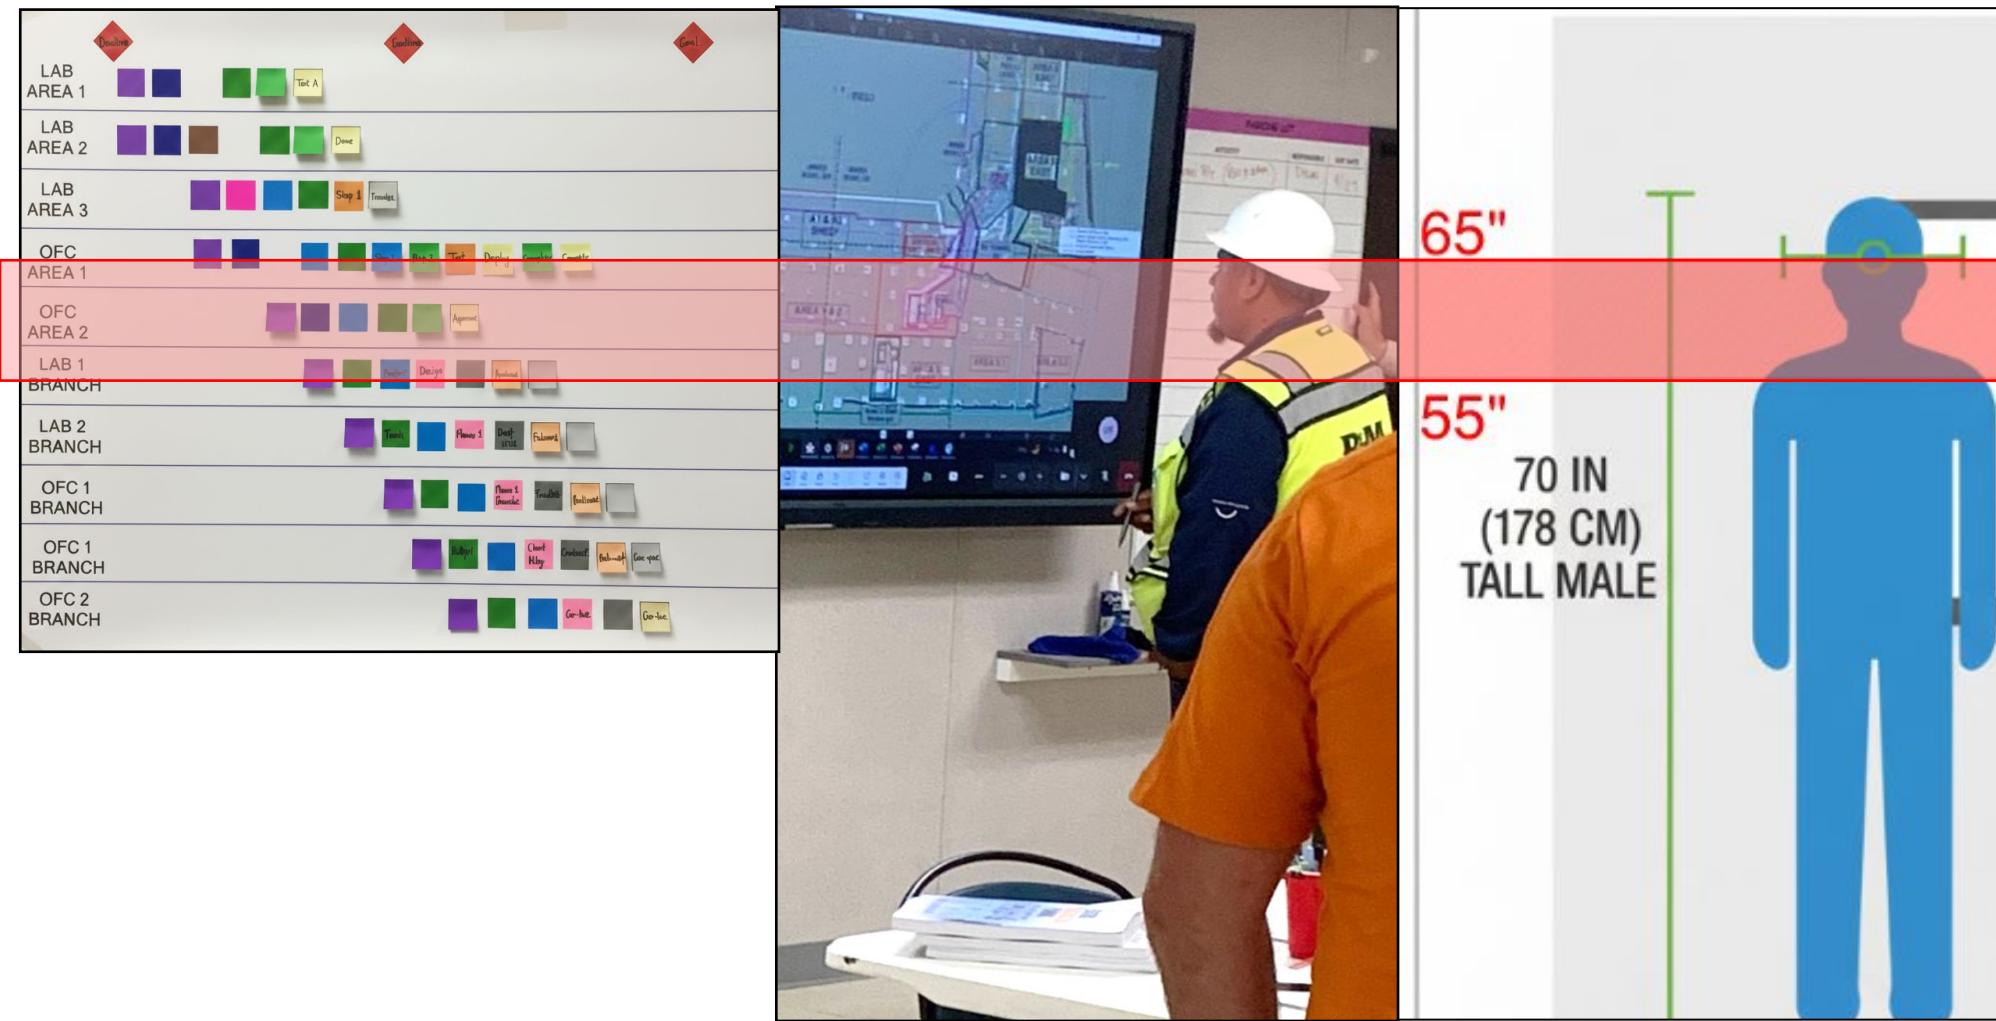

# Adaptation: Optimal Viewing

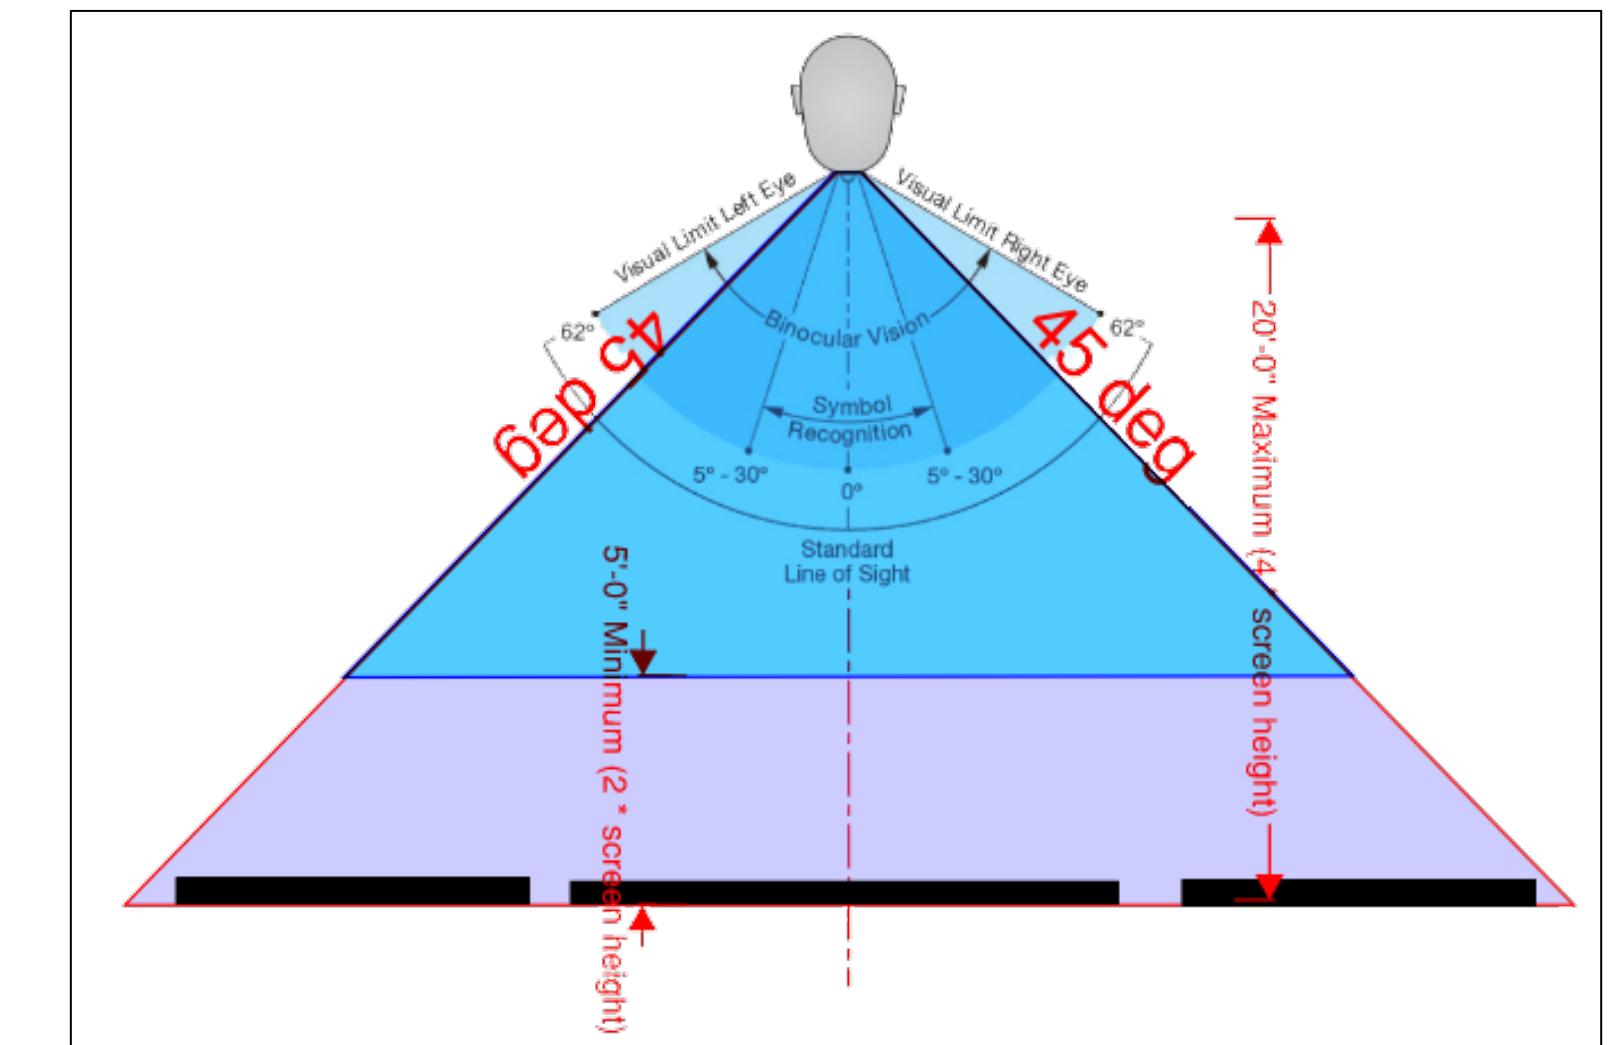

## The Pull Plan and the Projection Screen are the main visual workspaces

- The center of the primary working area should be between **55 and 65 inches (140–165 cm)** from the floor.
- **Maximum Viewing Angle:** Position the chart and screen so no participant is viewing it at an angle greater than 45 degrees off-center.
- **Distance:** The closest viewer should be **no nearer than 2 times the chart's height**, and the farthest viewer **no further than 4 times the chart's height**.

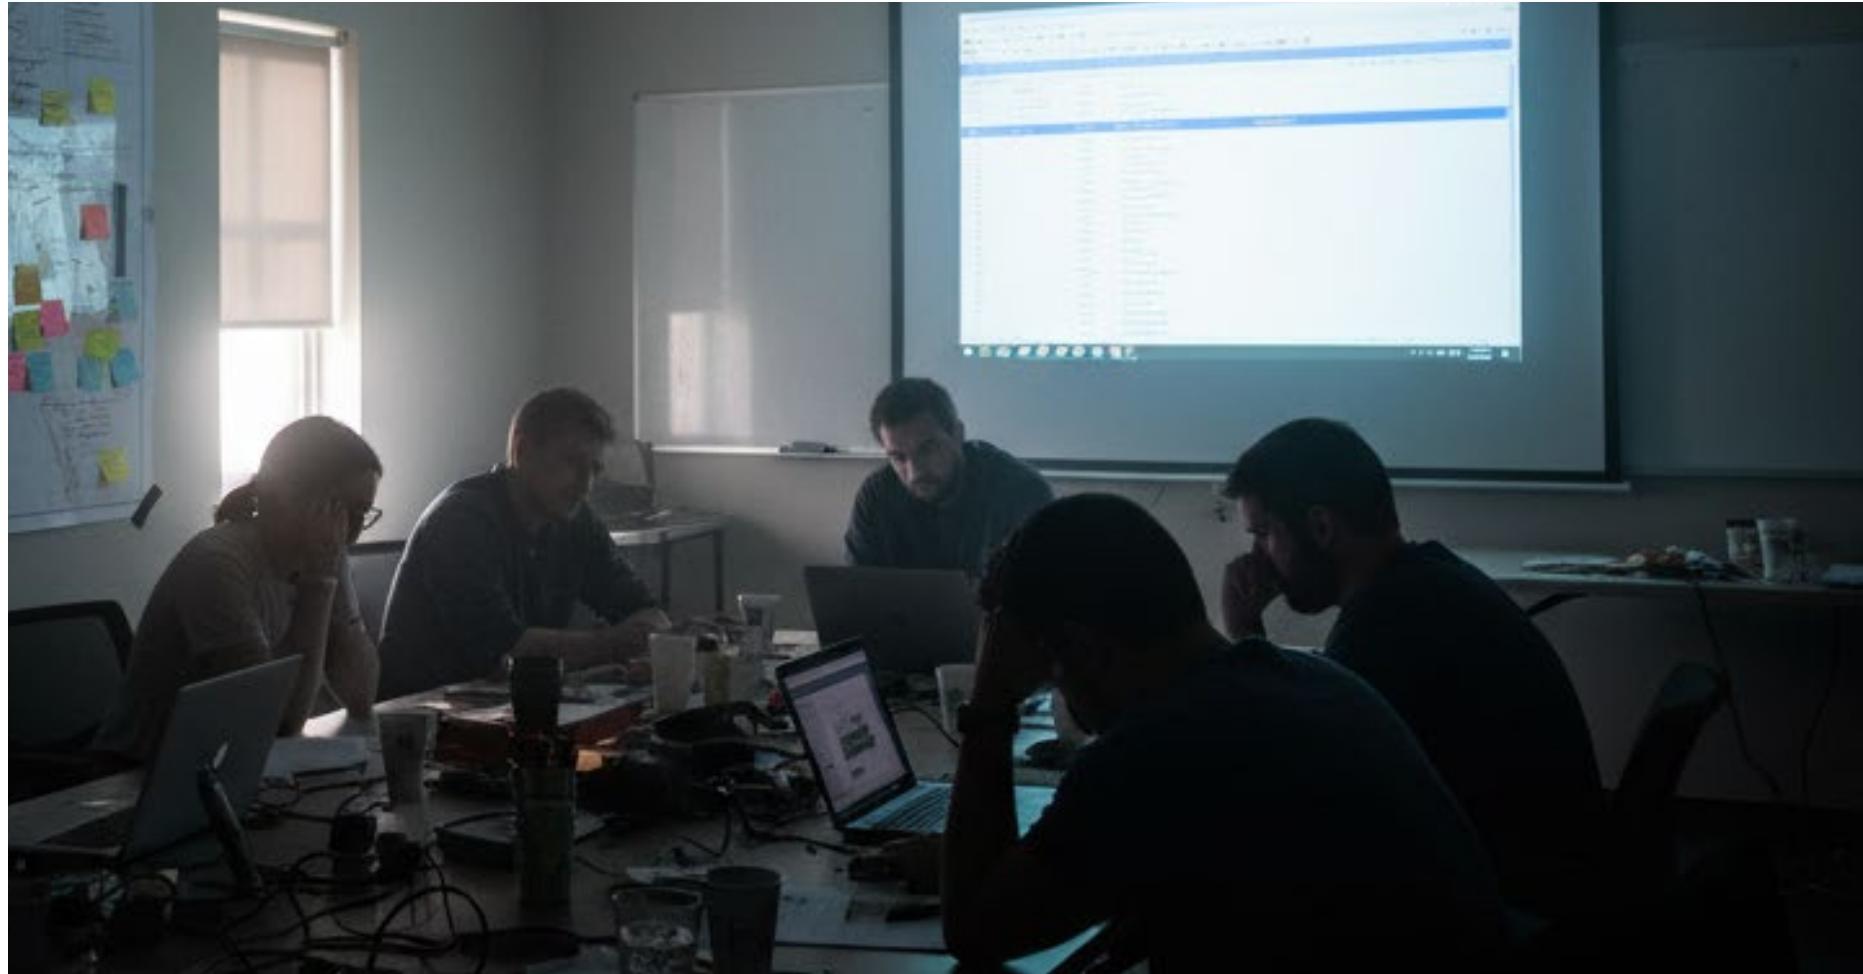

## OPTIMAL VIEWING HEIGHT

## OPTIMAL VIEWING ANGLE

# Adaptation: Environment

Poor lighting, unstable temperatures, and low air quality hinder collaboration and critical thinking because they force the brain to spend precious mental energy managing physical stress instead of focusing on the task at hand.

## Common Symptoms:

EYE STRAIN AND  
FATIGUE

FEELING SLUGGISH AND  
DROWSY

DIFFICULTY SUSTAINING  
ATTENTION

# Production Plans

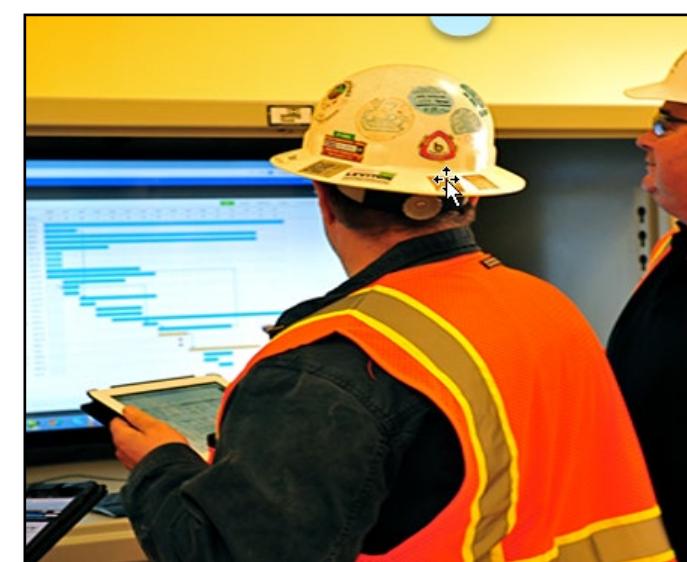

**1. The Team Creates the Sequence** - The Last Planners— map out the best order of work and define the crucial handoffs.

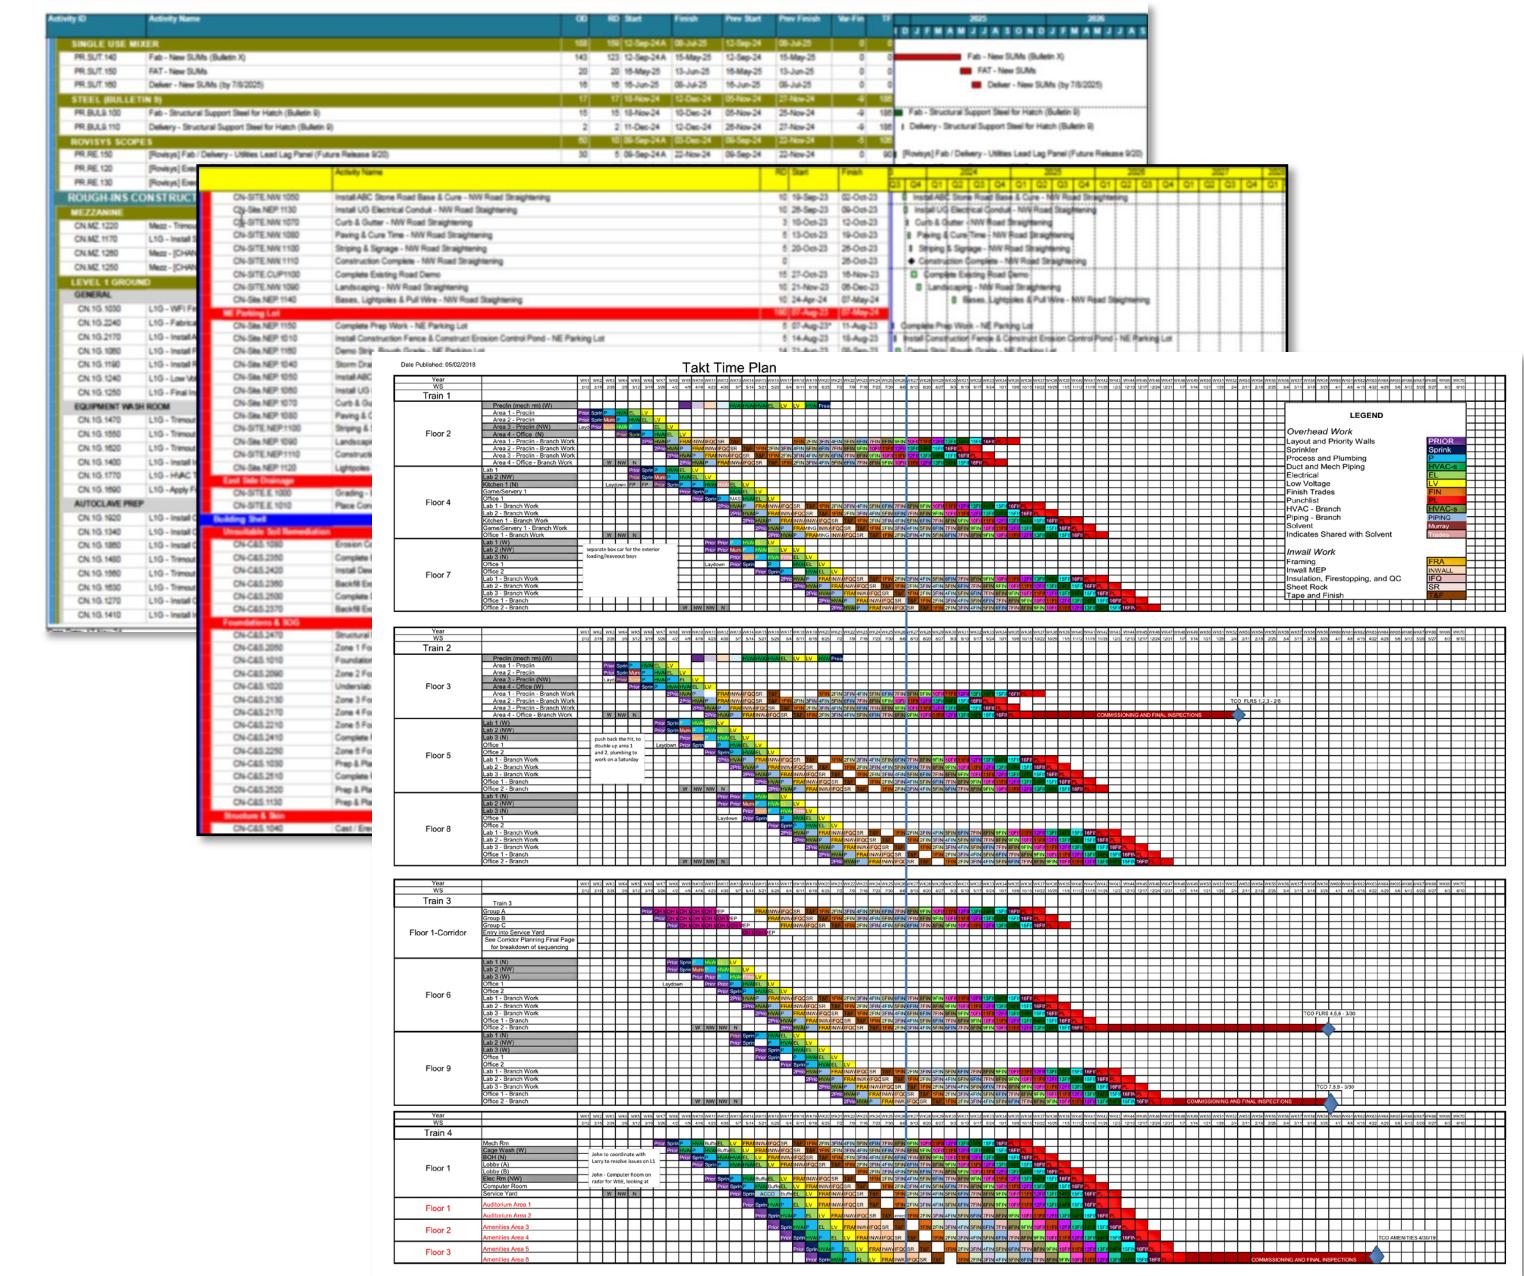

**2. The System Aligns the Plan** - The system takes the sequence and makes it realistic, by making work ready (clearing constraints) and ensuring resources are available

**Output:** A workable, validated workflow.

**3. The Schedule Sets the Dates** - This is the last step that **sets the dates**, turning the workflow into an actionable schedule with firm commitments.

# Summary of Beyond Post-Its

We focused on overcoming problems with rigid plans with the practice of **Specificity in Preparation and Adaptation in Execution.**

We learned specificity can be built by focusing on facts and data. **Work Density, Work Direction, and The “Train” of Works.**

Adaptation is built by ensuring the **environment** and the team is **prepared** and has an **optimal view**.

We addressed collaboration blockers with the **“Bias Buster”** exercise, realizing that behaviors which reduce trust leads to the **cost of silence**.
